

NSI-700S-70

Spherical Near-field Measurement System - 118 " (3.0 m) max AUT Dimension

DESCRIPTION

Model 700S-70 is an ideal system for measuring medium and low gain antennas up to 118 inches (3 m) in diameter and is ideally suited to perform cellular and PCS band base-station antenna testing. The 700S-70 uses a dual-axis phi-over-theta high accuracy stepper motor based positioning system with an adjustable extension foot for probe support. The system is constructed of modular high strength aluminum and can support loads of up to 300 pounds (136 kg). The location of the probe is adjustable to accommodate different configurations.

CAPABILITIES

The system interfaces with a wide variety of RF equipment and is capable of measuring amplitude and phase patterns from L-band to mmWave Bands. The Model 700S-70 includes NSI Antenna Measurement Software.

The system software runs on a Pentium based measurement workstation and provides automatic setup of scans based on measurement parameters and desired output. Measured data can be processed for far-field or holographic patterns yielding complete characterization of the antenna's performance. A single data set provides information on antenna gain, side lobe structure, beam pointing and cross polarization.

The Model 700S-70 can be supplied with a variety of options to enhance system performance.
